Temperature fan control using LM35 with microcontroller is a widely adopted method for automating cooling systems in various electronic and industrial applications. By integrating the LM35 temperature sensor with a microcontroller, engineers can design efficient, responsive, and reliable fan control systems that adjust airflow based on real-time temperature readings. This article explores the fundamentals of temperature fan control using the LM35 sensor, the components involved, the working principles, and practical implementation steps.

Understanding the LM35 Temperature Sensor

What is the LM35?

The LM35 is an precision integrated-circuit temperature sensor developed by National Semiconductor. It provides an output voltage linearly proportional to the Celsius temperature, making it straightforward to read and interpret. Unlike thermistors, the LM35 offers a higher accuracy and a wider temperature range, making it suitable for various control applications.

Key Features of LM35

- Linearly proportional voltage output (10mV/°C)
- Operates from 4V to 30V power supply
- High accuracy ($\pm 0.5^{\circ}\text{C}$ typical)
- Low self-heating (less than 0.1°C in still air)
- Temperature range: -55°C to $+150^{\circ}\text{C}$

Working Principle

The LM35 outputs a voltage directly proportional to the temperature in Celsius. For example, at 25°C , it outputs approximately 250mV. This linearity simplifies the conversion of analog voltage readings into temperature values using an analog-to-digital converter (ADC) in a microcontroller.

Components Needed for Temperature Fan Control System

Building an automated fan control system using LM35 involves several hardware components:

1. Microcontroller

Common choices include Arduino, ESP32, or PIC microcontrollers. They process sensor data and control the fan based on programmed thresholds.

2. LM35 Temperature Sensor

Provides real-time temperature data.

3. Fan (DC Fan or PWM Fan)

The device to be controlled, which cools the environment or device.

4. Relay Module or Motor Driver

Allows the microcontroller to switch high current loads like fans safely.

5. Power Supply

Supplying adequate voltage and current for the microcontroller, sensor, and fan.

6. Connecting Wires and Breadboard or PCB

For assembling the circuit.

Working Principle of Temperature Fan Control

The core idea is to continuously monitor the ambient or device temperature using the LM35 sensor. When the temperature exceeds a predefined threshold, the system activates the fan to cool down the environment. Conversely, when the temperature drops below the threshold, the fan turns off to save energy.

Key steps include:

- Reading the analog voltage from the LM35 via ADC
- Converting the ADC value to temperature in Celsius
- Comparing the temperature with set thresholds
- Controlling the fan via relay or PWM based on the comparison

Implementation Steps

Step 1: Circuit Design

Designing the schematic involves connecting the LM35's Vout pin to an ADC input of the microcontroller, connecting power and ground appropriately, and integrating the relay or motor driver to control the fan.

Sample connections:

- LM35 Vout to Microcontroller ADC pin (e.g., A0)
- LM35 Vcc to 5V or 3.3V supply
- LM35 GND to ground
- Fan connected through relay to power supply
- Relay control pin connected to microcontroller digital output pin

Step 2: Programming the Microcontroller

Develop firmware to perform the following:

- Initialize ADC and digital output pins
- Read voltage from LM35
- Convert voltage to temperature
- Implement control logic to turn fan ON/OFF

Sample pseudocode:

...

initialize ADC

initialize relay control pin

while (true) {

 adc_value = readADC(LM35_pin)

 voltage = adc_value (Vref / ADC_resolution)

 temperature = voltage / 0.01 // since 10mV/°C

```
if (temperature > threshold) {  
  
    turnFanOn()  
  
} else {  
  
    turnFanOff()  
  
}  
  
delay(1000) // wait for 1 second  
  
}  
  
...
```

Step 3: Calibration and Testing

- Calibrate the sensor by comparing readings with a known temperature source.
