The second edition emphasizes theoretical foundations while maintaining practical relevance through examples and case studies.

Core Concepts in Digital Image Processing

- Image Representation

Images are represented as matrices of pixel values. Each pixel encodes information about intensity and color, depending on whether the image is grayscale or color.

- Grayscale images: 2D matrices with intensity values, typically ranging from 0 (black) to 255 (white).
- Color images: Multiple matrices (e.g., RGB channels) or alternative color spaces like YCbCr or HSV.

- Image Acquisition

The quality of the digital image depends on the acquisition process, which involves sensors like cameras and scanners. Factors influencing image quality include resolution, noise, and lighting conditions.

Image Enhancement Techniques

Enhancement aims to improve visual appearance or accentuate certain features.

a) Spatial Domain Processing

- Point Processing: Operations that modify individual pixels, such as contrast stretching, histogram equalization, and negative transformation.
- Neighborhood Processing: Techniques involving pixel neighborhoods like smoothing filters (mean, median) and sharpening filters (Laplacian, high-pass).
